

CubeSat project for sounding the atmosphere of Mars

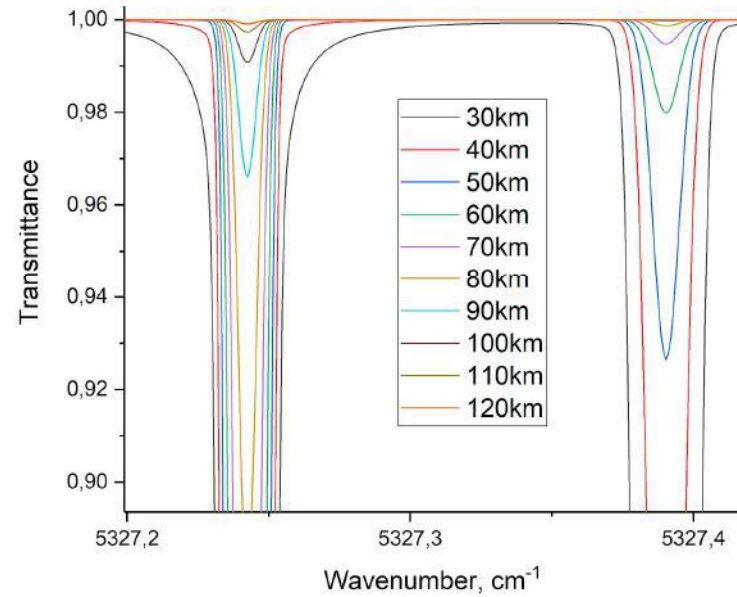

Laboratory of Applied Infrared Spectroscopy (AIRS)

Iskander Gazizov, Sergei Zenevich and Alexander Rodin

5th IAA Conference
CubeSat on Mars perspectives
2020, Rome

Observation method

Synthetic spectra

MLHS instrument configuration for 6U CubeSat

	Bandwidth, nm	Weight, kg	Resolution, cm^{-1}
ACS NIR on TGO	900	3.2	0.35
SPICAM IR on Mars Express	700	4	3.5
MLHS on CubeSat	0.2	3	~ 0.0003

ACS

SPICAM IR

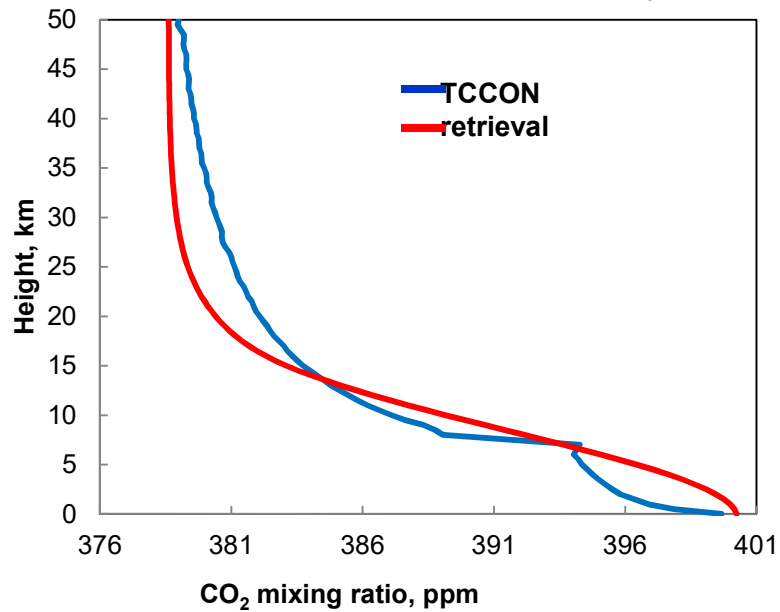

MLHS

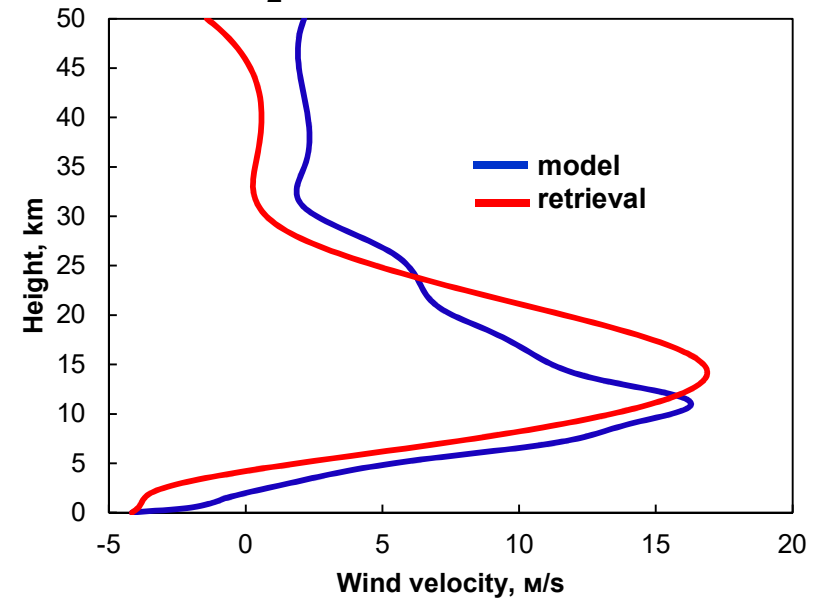

Earth atmospheric measurements by MLHS

Observed CO₂ absorption line and model fit

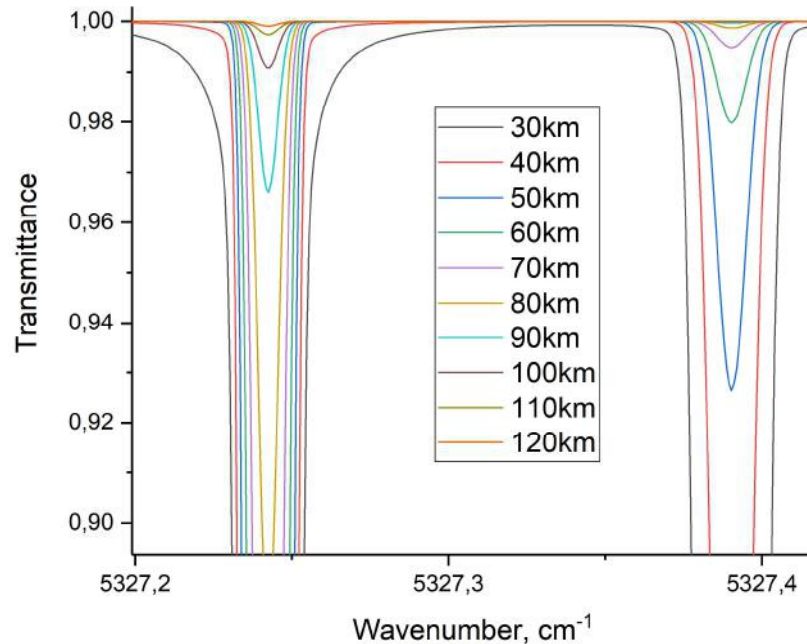

Retrieved CO₂ concentration profile

Wind profile retrieved from CO₂ absorption line

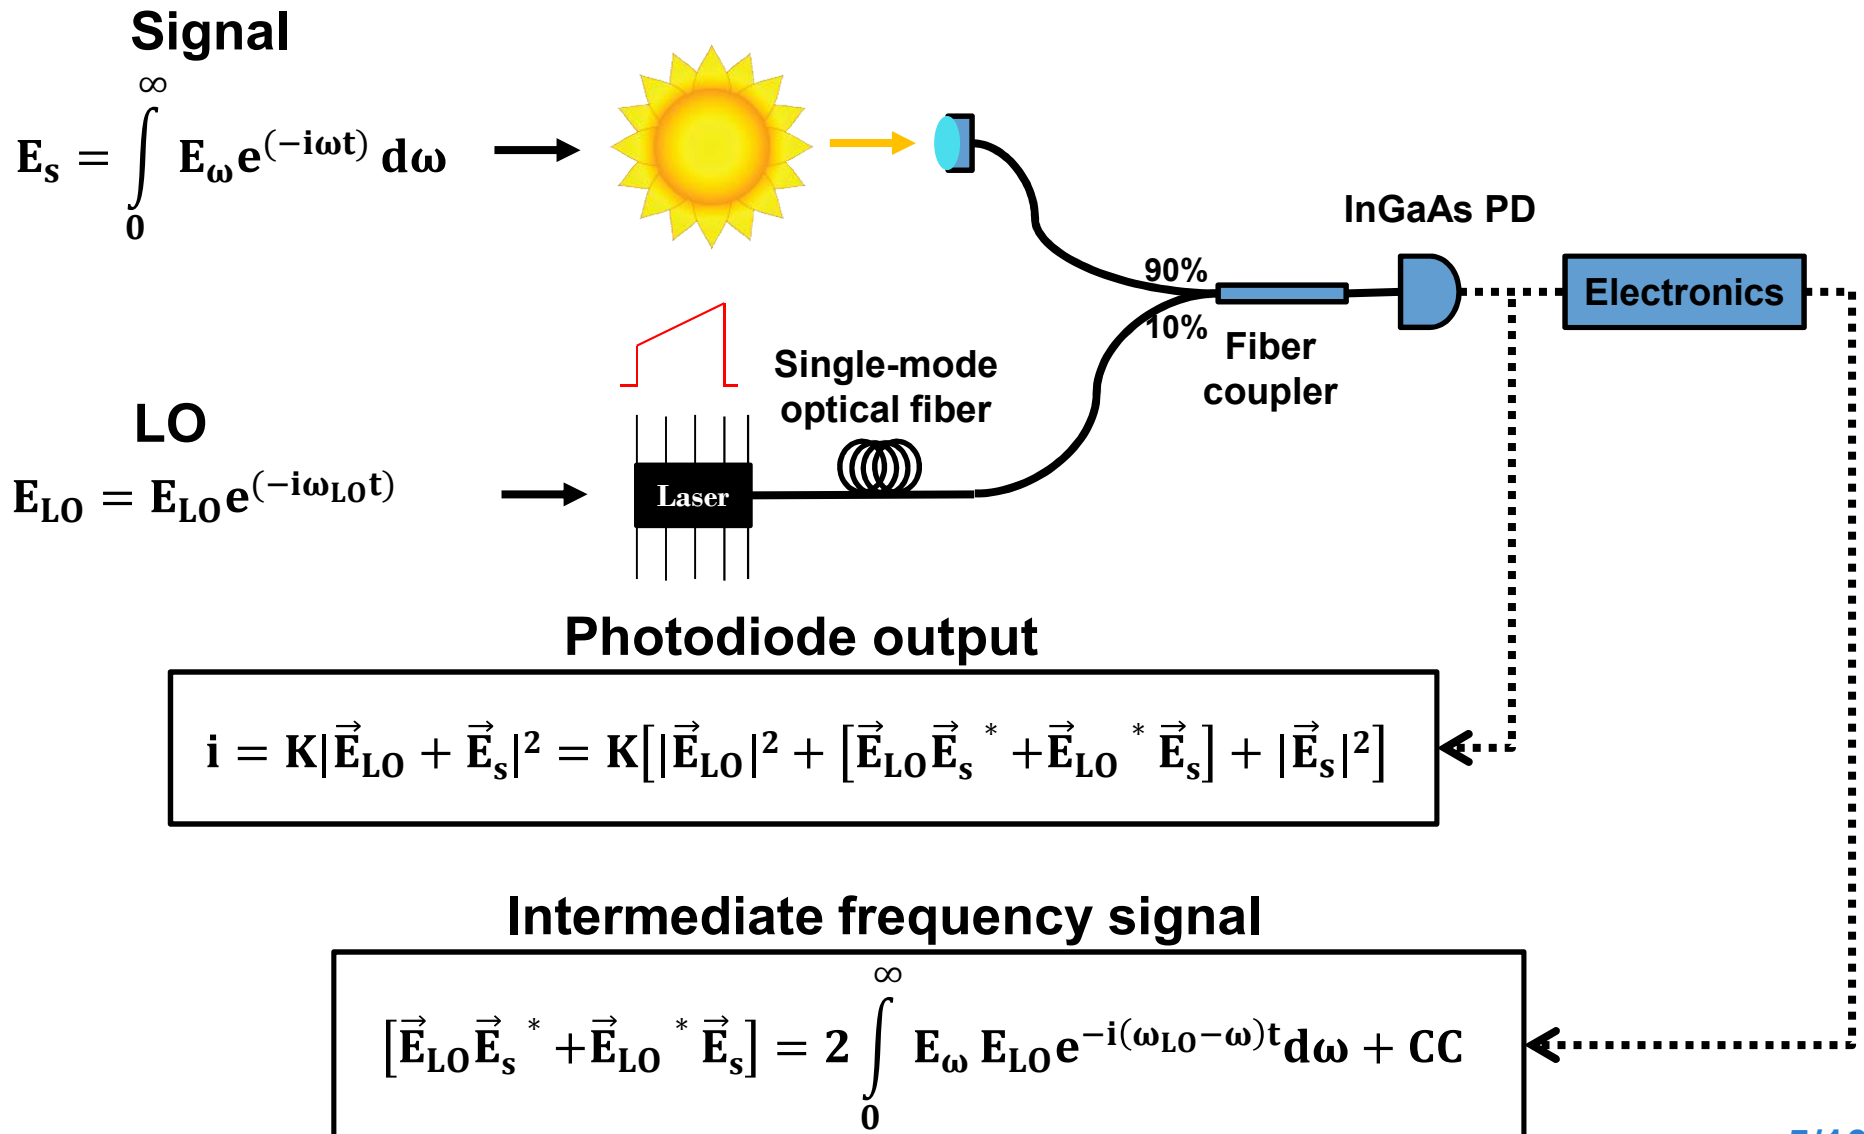

Observation method

$$\lambda = 1.87 \mu\text{m}$$

Synthetic transmission spectra for CO₂ and H₂O in solar occultation observation for different tangent heights in the range 30-120 km

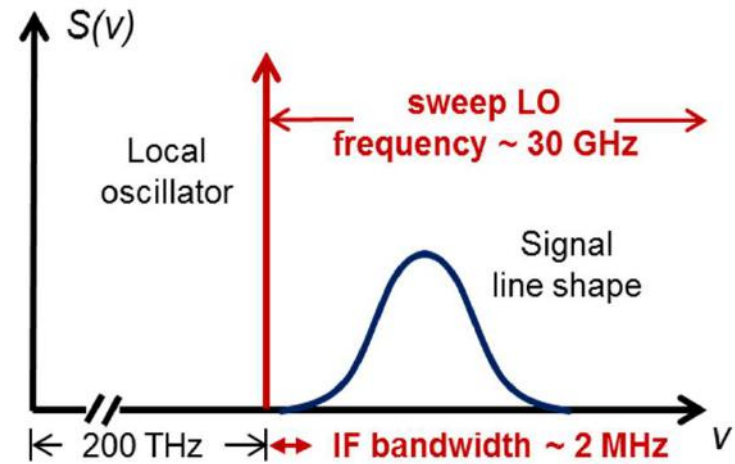

Standard approach:

- Constant frequency LO
- Wide bandwidth of IF

Our approach:

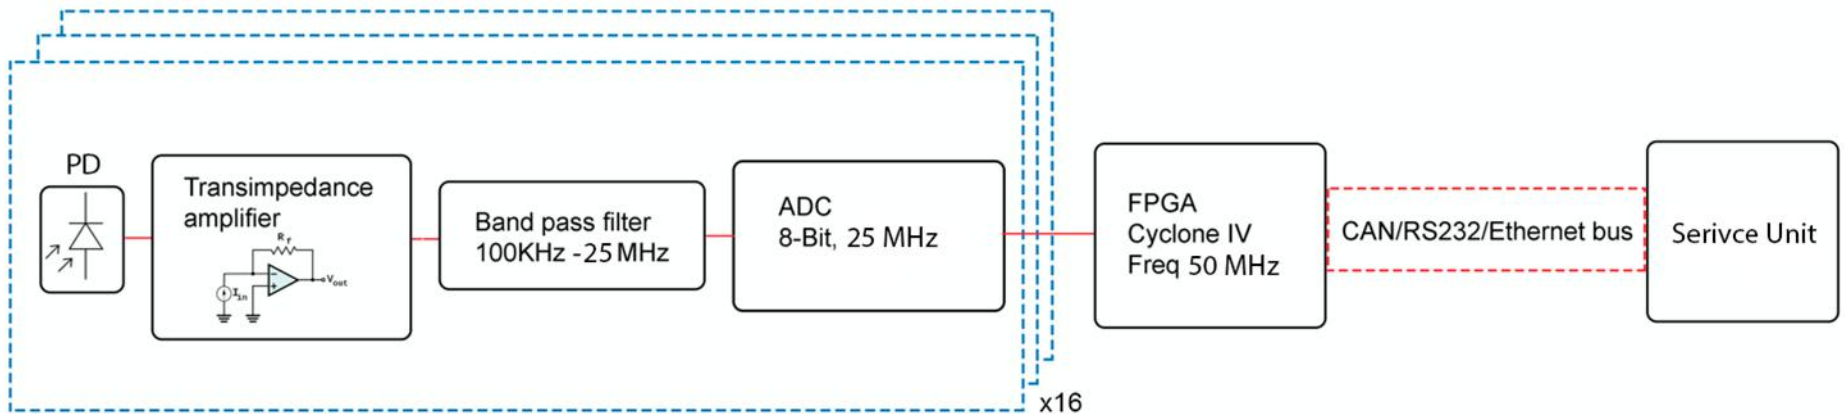

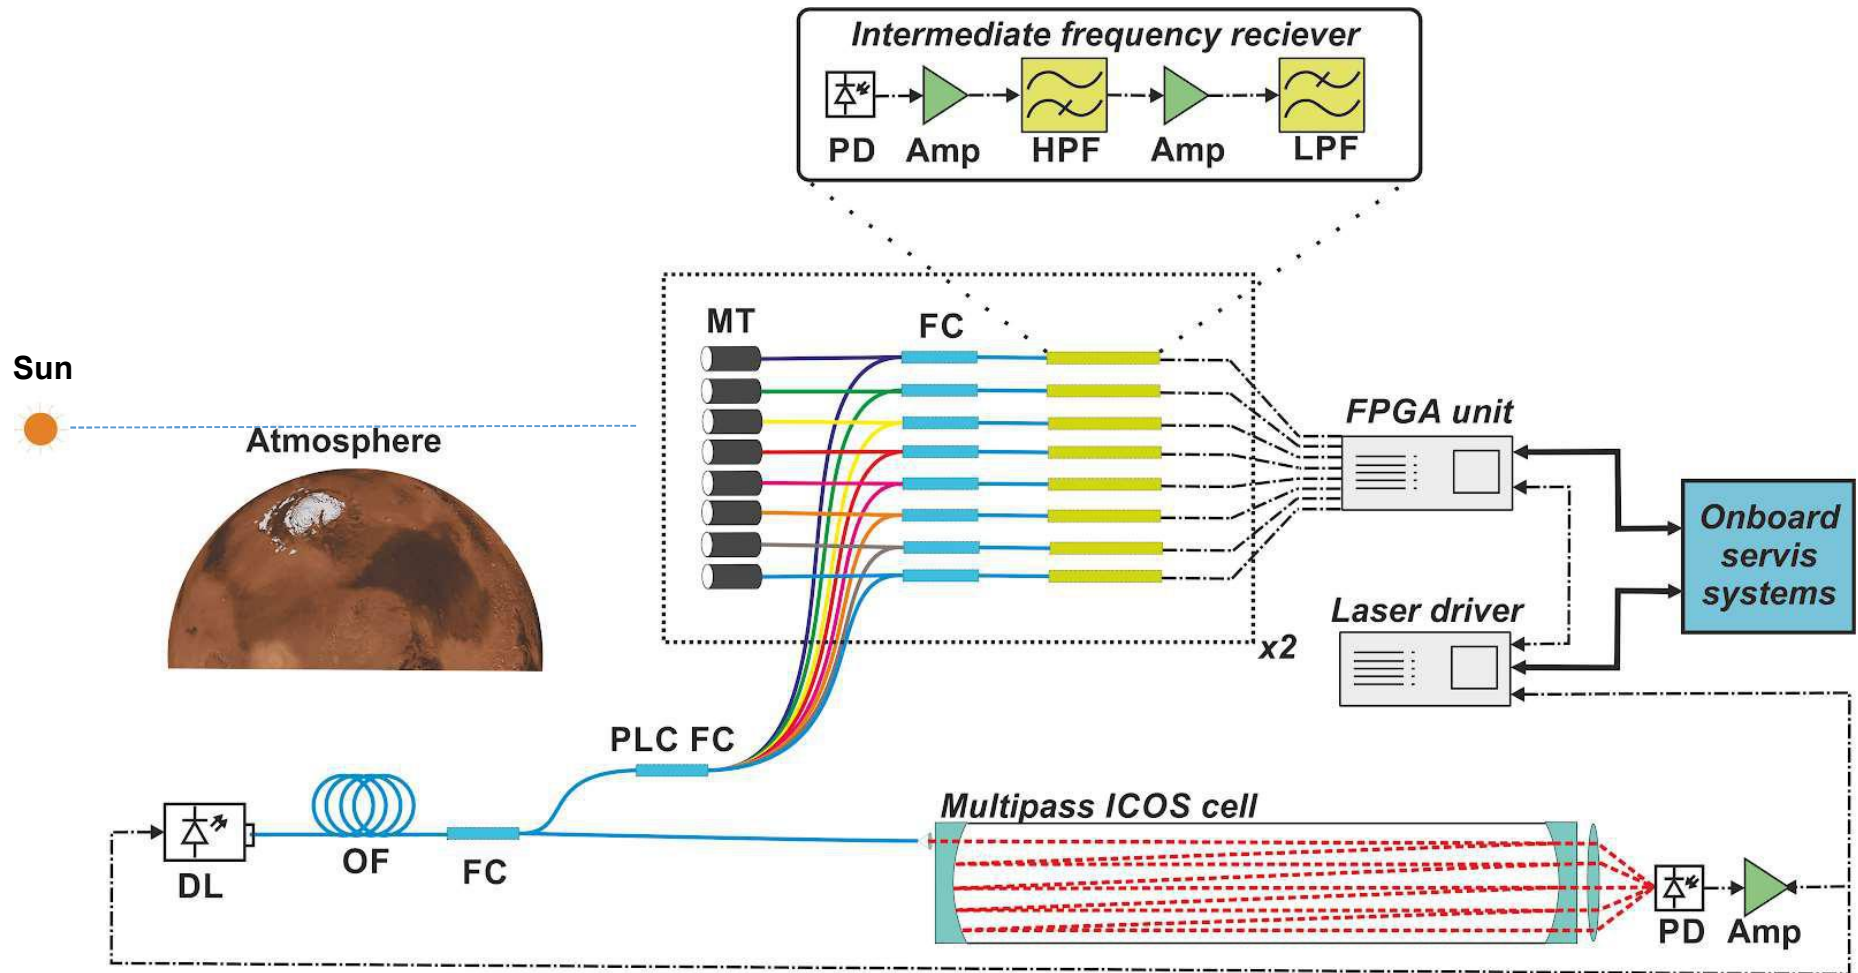

- Sweeping LO frequency
- Narrow bandwidth of IF

Advantages:

- Don't have to use IF spectrum analyzer
- Compactness
- Advanced frequency locking techniques
- Don't need special sideband treatment

Payload signal processing

CubeSat 6U formfactor

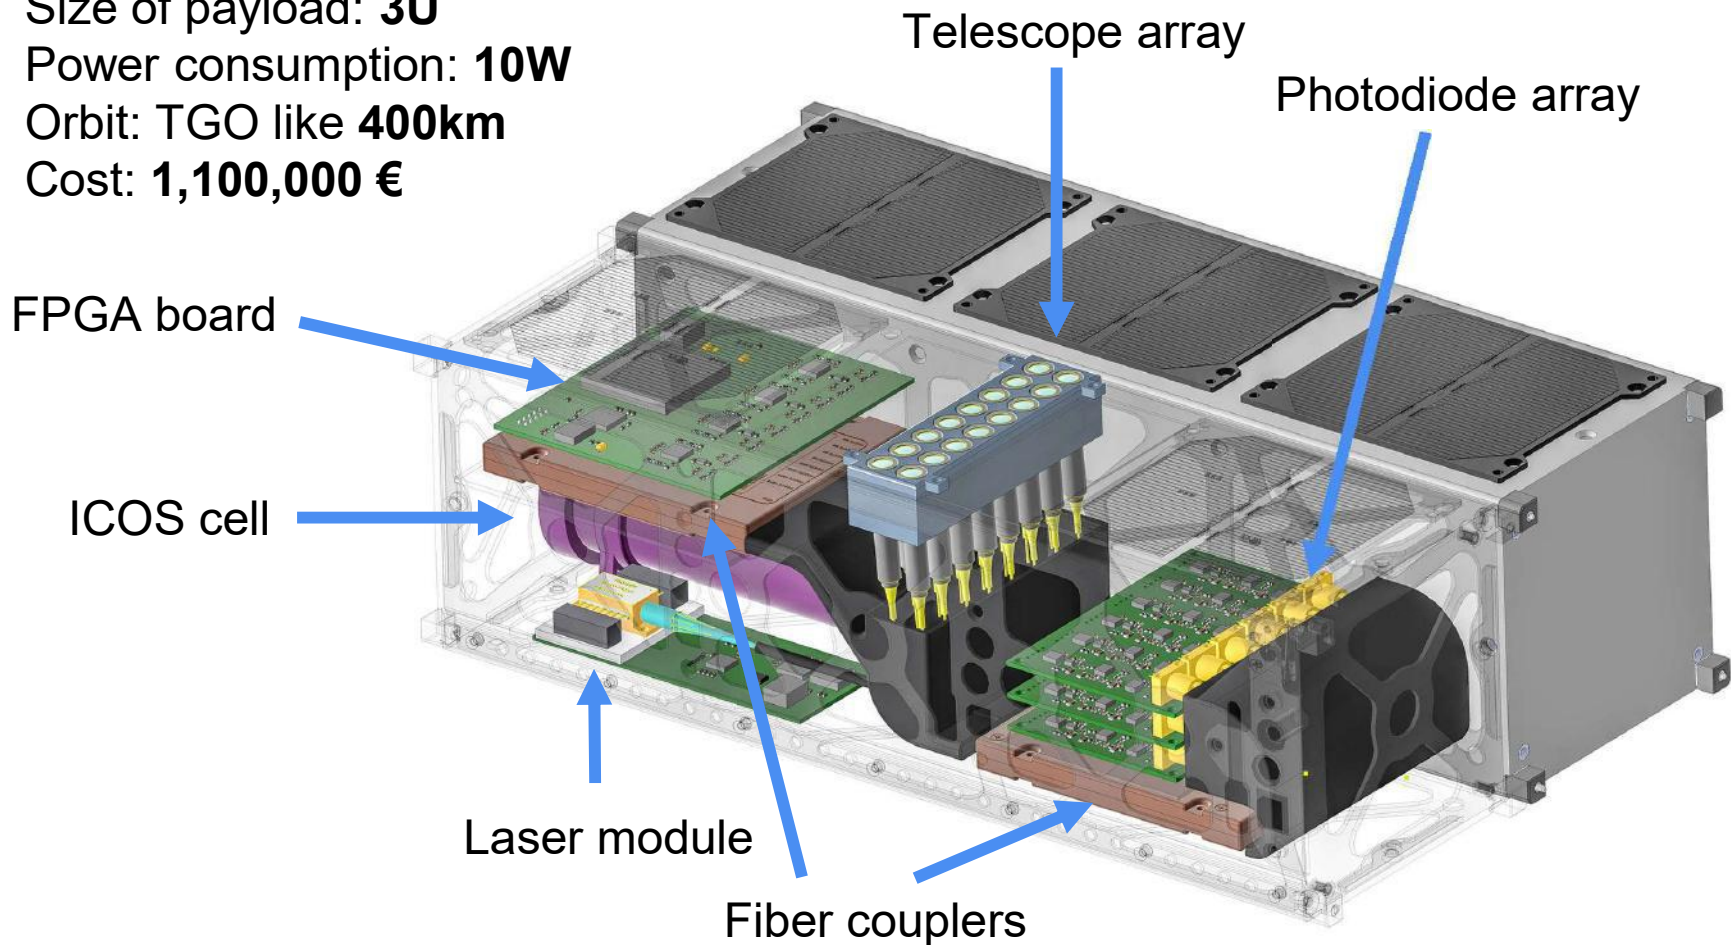

Approximate mass of payload: **3 kg**

Size of payload: **3U**

Power consumption: **10W**

Orbit: TGO like **400km**

Cost: **1,100,000 €**

Now:

M-DLS spectrometer developed by IKI and MIPT

M-DLS integrated with ExoMars2020 landing platform

Future:

IVOLGA: a laser heterodyne NIR spectrometer for studying of structure and dynamics of the Venusian mesosphere.
